

CRM LEAD FUNNEL ANALYSIS

Business Analytics Internship Project

Palak Mittal

Business Analyst Intern

July 2026

Analysis based on a self-built simulated dataset created during my internship to preserve confidentiality. No confidential company data has been used.

Sawalsha Leasing & Finance Pvt. Ltd.

EXECUTIVE OVERVIEW

Executive Summary

Methodology: based on a self-built mock dataset of 300 simulated leads, created to practice Phases 1–5 concepts — not real company data.

300

TOTAL LEADS

25%

CONVERSION RATE

35%

EARLY DROP-OFF

30%

INCOME-BASED REJECTIONS

EXECUTIVE TAKEAWAYS

- Early-stage lead leakage is the largest opportunity.
- Salary is the strongest predictor of conversion.
- Lead reachability is an operational opportunity rather than a lead-quality issue.
- Funnel optimization should focus before credit evaluation.

Business Problem

OBJECTIVE

Identify where loan applications are being lost across the CRM funnel and recommend operational improvements to improve conversion and reduce wasted sales effort.

DATASET

300

Executive Presentation

Actionable Recommendations

SECTION 01 — FUNNEL PERFORMANCE

Lead Funnel Breakdown

Status distribution across all 300 leads

KEY INSIGHT

The majority of lead losses occur before formal evaluation, indicating that improvements in lead qualification and reachability would likely deliver greater business impact than changes to underwriting.

Disbursed leads (75) represent the highest single status; No Answer (47) is the largest non-converted group.

SECTION 02 — REJECTION DRIVERS

Root Cause Analysis

Breakdown of 67 Rejected / Not Eligible leads by reason

KEY FINDING

Low Salary accounts for ~30% of all rejections — nearly 2x the next cause.

BY CATEGORY

Income-Related	31
Low Salary + Self Employed	
Documentation	18
Email, Payslip, Docs	
Credit-Based	9
Low CIBIL	

SECTION 03 — WHERE LEADS ARE LOST

Preventable Funnel Loss vs. Evaluation Loss

Where in the funnel are leads actually being lost?

PREVENTABLE FUNNEL LOSS

105 (35%)

Not Eligible, No Answer, Not Interested — lost before formal evaluation

EVALUATION LOSS

39 (13%)

Rejected after credit / document evaluation

The funnel loses nearly three times as many leads before evaluation as after evaluation.

SECTION 04 — LEAD QUALITY

Lead Quality Insights

₹ ₹37,933

Avg. Salary — Disbursed

₹ ₹33,025

Avg. Salary — Rejected

KEY INSIGHT

Salary demonstrates a meaningful relationship with successful conversion within the simulated dataset — a genuine predictor, not incidental.

Reachability Is Operational, Not Quality

47 leads (15.7%) fall under No Answer — the single largest status after Disbursed. These leads were never reached, not disqualified, making this a recoverable, operational gap rather than a lead-quality problem.

Not Eligible vs. Rejected — Cost of Loss

Not Eligible (28) leads are filtered early, consuming little effort. Rejected (39) leads have already absorbed telecalling and evaluation resources before failing — a costlier type of loss.

SYNTHESIS

Key Business Insights

Top Funnel

The funnel's biggest loss is early-stage, not late-stage — top-of-funnel fixes have more leverage than adjusting credit evaluation.

Income Quality

Income-related disqualification (Low Salary + Self Employed) outweighs documentation and credit-score issues combined.

Lead Reachability

No Answer reflects an operational gap in reachability, not a quality-of-lead gap — likely more fixable than rejection.

Qualification Process

Disbursed leads show meaningfully higher average salary than Rejected leads, validating salary as a real early signal.

Improvement Recommendations

HIGH IMPACT

Refine ad targeting toward higher-income segments to reduce Low Salary rejections — the single largest rejection driver.

Introduce a lightweight salary/location pre-screen at the landing page, before a lead enters the CRM, to cut wasted telecalling effort.

OPERATIONAL IMPROVEMENTS

Review telecalling call-timing and retry cadence to address the No Answer bucket (47 leads, 15.7%) — unreached, not disqualified.

Treat Self Employed applicants as a distinct workflow with tailored documentation requirements given their disproportionate rejection rate.

LOOKING AHEAD

Future Scope

This analysis used a self-built mock dataset to practice training concepts.

Call Timing Analysis

Test whether No Answer rates vary by time of day or day of week.

Cost-per-Lead Analysis

Assess ROI by source, not just volume — a high-volume source isn't necessarily high-value.

Geographical Conversion Analysis

Check whether drop-off causes vary geographically, warranting localized fixes.

Thank You
